Abstract	This document gathers three examples of FDS code to simulate vulnerability and sheltering virtual experiments in Wildland-Urban-Interface scenarios. The three cases are used as baseline scenarios in D6.1. The first example represents a scenario in which a glazing system is exposed to radiation coming from two ornamental trees; the second represents a typical scenario including non-natural fuels burning in a semi-confined space close to an LPG tank. The last example represents a simulation of sheltering capabilities of a house exposed to a wildfire front. This deliverable underlines the WUIVIEW consortium commitment to share our FDS codes with the community of practitioners, so to improve and explore better and new applications for the protection of structures in forest fire environments.

1. About this deliverable

WUIVIEW stands for Wildland-Urban Interface Virtual Essays Workbench, and is a project funded by the Directorate General for European Civil Protection and Humanitarian Aid Operations (DG ECHO) and coordinated by the Universitat Politècnica de Catalunya (Spain). The project objective is to develop a ‘virtual laboratory’ based on Performance Based Design (PBD) and Computational Fluid Dynamics (CFD) models for the analysis and assessment of the processes and factors driving structure damage in forest fires. The results will serve as guidelines and recommendations of good practices for the protection and prevention of forest fires in European communities inserted in forested lands.

The project is divided into 8 work packages, out of which work package 6 is devoted to test pattern scenarios defined in previous WP5 in terms of structure survivability and sheltering capacity. This is the second deliverable of WP6. In this document we make available for the community of practitioners a sample of three baseline scenarios used in D6.1. We have chosen as representative examples *i*) a scenario of a glazing system exposed to ornamental trees burning; *ii*) a scenario of non-natural fuels burning in a semi-confined space close to an LPG tank; *iii*) a scenario to test sheltering capabilities of a house close to a wildfire front. We provide a simple explanation of the scenario (fire source and asset exposed) followed by the FDS code by which we have analysed the problem.

The WUIVIEW project aims at providing fire practitioners with new capabilities for fire risk managing, engineering, research and fire safety building design. This deliverable underlines the WUVIEW consortium commitment with this objective. By sharing our FDS codes with the community of practitioners, we believe we are contributing to improve and better explore the use of CFD simulators for the protection of structures in forest fire environments.

2. Scenario 1: Glazing systems

2.1. Scenario description

Scenario 1 consists of a glazing system exposed to radiation coming from two burning Douglas fir trees (*Pseudotsuga menziesii*) located at a distance of 1 m, as can be seen in Figure 1. It corresponds to one of the baselines scenarios used in section 4.2 from past deliverable D6.1.

The system consists of a single pane window with a glass thickness of 3 mm and a frame made out of uPVC.

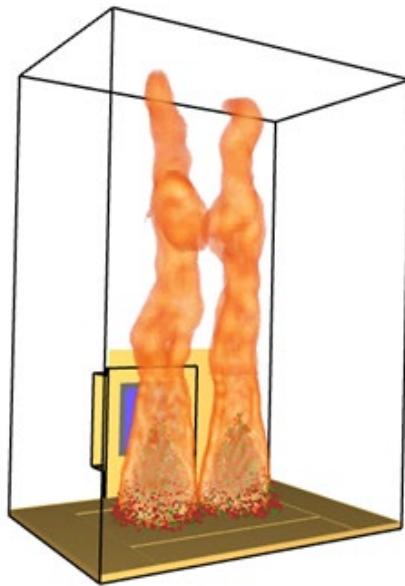

Figure 1: Scenario 1

The trees are made out of 4 different types of particles (foliage, small roundwood, medium roundwood and big roundwood), and each type has its own moisture content and packing ratio (Mell et al., 2009). In this case, the Heat Release Rate (HRR) is not prescribed, but it is computed during the simulation. The tree particles are ignited with the help of other particles which will burn for 10 s.

Outputs are recorded by devices that are placed on the glass and on the frame. They record the radiative heat flux onto the glass and the surface temperature of the glass and the frame over time. Gas temperatures by solid surfaces are also recorded in a boundary file.

The simulation ran for about 7 hours on a PC with 4 cores and 8 logical processors. FDS version 6.7.3 was used.

3. Scenario 2: LPG tank and semi-confined space

3.1. Scenario description

Scenario 2 consists of an LPG tank of 1 m³ located 1 m from a semi-confined space with the dimensions of 2.5x2.5x2.5 m. This space contains a fuel pack of wooden pellets, which is located in the left back corner, as shown in Figure 2. It corresponds to one of the baselines scenarios used in section 4.4 from past deliverable D6.1 “Recommendations on structure survivability and sheltering capacity”.

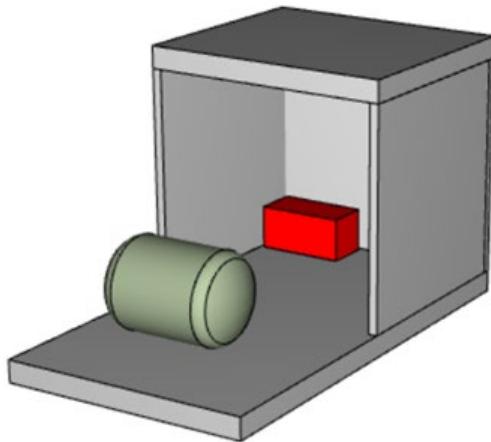

Figure 2: Scenario 2 setup

In this scenario the fire is represented by a solid obstacle. Vents with the assigned fire characteristics are attached to the obstacle. The fire curve is here prescribed by assigning a Heat Release Rate Per Unit Area (HRRPUA) and a RAMP to the fire surface.

Outputs recording temperature profiles through the walls are generated with a PROF line. Boundary files are added to registering the gas temperature, the heat transfer coefficient and the incident heat flux onto the tank.

The simulation ran for about 3 days on a PC with 4 cores and 8 logical processors. FDS version 6.7.3 was used.

4. Scenario 3: Sheltering at 10 m

4.1. Scenario description

Scenario 3 consists of a house exposed to a fire front located at a distance of 10 m, as can be seen in Figure 3. It corresponds to one of the baselines scenarios used in section 5.3 from past deliverable D6.1.

The house has most of its windows open, as well as the main door. The fire front specified has an area of $2 \text{ m} \times 27 \text{ m}$. A heat release rate per unit area (HRRPUA) of 2700 kW/m^2 is set at the surface of the thin obstacle used to define the front. A front temperature of 1000 K is also predetermined. The HRRPUA ramps up quickly (1 s ramp) once the wind field is stabilized (approximately 250 s after the beginning of the simulation).

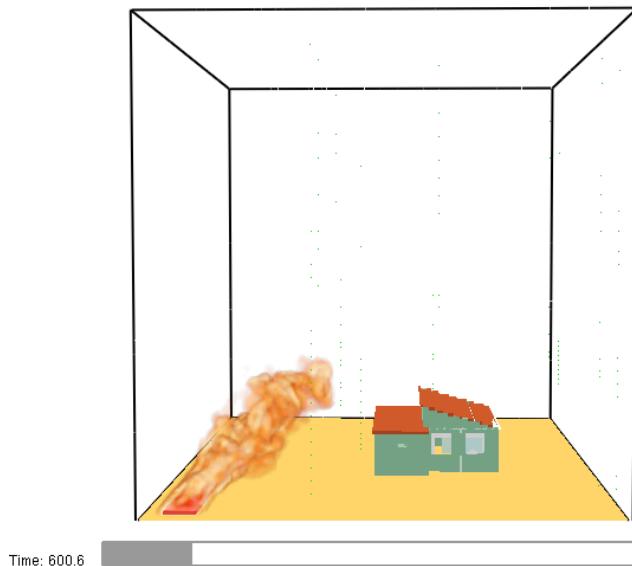

Figure 3: Scenario 3

Outputs are recorded by planar slices and devices. The simulation was executed and the resulting data, comprising of several devices and slices, was used for data analysis in D6.1. A reduced version of the FDS input file is shown here in order to limit the amount of code. For readability, we exclude devices set far from the house as well as density and pressure variables for slices and devices. Finally, only measurements at a height $\leq 4 \text{ m}$ are included.

Planar slices are placed on the z-plane at several heights. Also, slices crossing the house on the x- and y-planes have been defined (see D6.1., Figure 79). Slices are set to record temperature, velocity and the volume fraction of the different species defined in the combustion reaction.

Devices have been defined outdoors (see D6.1., Figure 79) and within the house (see D6.1., Figure 80) at different heights. Devices record the time evolution of the same variables set for slices, together with the radiative heat flux.

The simulation ran for about 20 days on a PC with 8 cores and 16 logical processors. FDS version 6.7.3 was used.
